St Vincent's Catholic Primary School

Calculation Policy 2015

## Introduction

This policy focuses on the four operations of addition, subtraction, multiplication and division and includes a list of the key mental maths skills that support written methods.

For each operation, there are four stages, starting with the practical methods that support conceptual understanding moving through to methods that allow children to demonstrate efficiency in procedural approaches.

All maths lessons must follow the methods in the policy and be taught in the stages set out in each of the four sections.

The presentation of calculations is vital and all children must be encouraged to set their written methods out neatly, well-spaced and in line with the examples shown in this policy.

Where straight lines are required children should always use a ruler.

## Addition

## Written methods for addition

It is important that children's mental methods of calculation are practised on a regular basis and secured alongside their learning and use of written methods of addition.

The aim is that children use mental methods when appropriate, but for calculations that they cannot do in their heads they use a written method accurately and with confidence.

Children are taught and acquire secure mental methods of calculation and one written method of calculation for addition which they know they can rely on when mental methods are not appropriate.

This policy shows the possible stages of each written method for addition, each stage building towards a more refined method.

## There are some key basic skills that children need to help with addition, which include:

- counting
- estimating
- recalling all addition pairs to 10,20 and $100(7+3=10,17+3=20,70+30=100)$
- knowing number facts to $10(6+2=8)$
- adding mentally a series of one-digit numbers $(5+8+4)$
- adding multiples of $10(60+70)$ or of $100(600+700)$ using the related addition fact, $6+7$, and their knowledge of place value
- partitioning two-digit and three-digit numbers into multiples of 100,10 and 1 in different ways ( 432 into $400+30+2$ and also into $300+120+12$ )
- understanding and using addition and subtraction as inverse operations

Using and applying is a key theme and one of the aims of National Curriculum and before children move onto the next stage in written calculation it is important that their skills are broadened through their use and application in a range of contexts, these include:

- using inverse
- missing box questions
- using units of measure including money and time
- word problems
- open ended investigations

## Stage 1: Practical (combining) and adding on (increasing)

Prior to recording addition steps on a number line, children will work practically with equipment where they are combining sets of objects. As they become more confident, this practical addition of sets of objects will be mirrored on a number line so that the two are being done together and children are
adding on. This will prepare them for the abstract concept of adding numbers rather than objects.

## Stage 2: Number tracks and number lines

Steps in addition can be recorded on a number line. The steps often bridge through a multiple of 10 and, this is more efficient if children know how to partition 1-digit numbers.
$8+7=15$

$48+36=84$

or

With practice, children will need to record fewer jumps

In this example, 7 has been partitioned into 2 and 5 which makes bridging through 10 more efficient

In these examples, the 6 in 36 has been partitioned into 2 and 4 which makes bridging through 10 more efficient

## Stage 3: Partitioning (expanded columnar method)

Partition both numbers into tens and units or hundreds, tens and units (using a grid makes this easier).

| $48+36=84$ |  |  |  |
| :---: | :---: | :---: | :---: |
|  | 40 | 8 |  |
| + | 30 | 6 |  |
|  | 70 | 14 | 84 |

| $148+36=184$ |  |  |  |  |
| :---: | ---: | ---: | ---: | ---: |
|  | 100 | 40 | 8 |  |
| + |  | 30 | 6 |  |
|  | 100 | 70 | 1 | 18 |
|  | 184 |  |  |  |

This builds on children's mental maths skills of partitioning and recombining $40+30=70$ $8+6=14$ $48+36=84$

## Stage 4: Efficient (column method)

Column addition remains efficient when used with larger whole numbers or decimals, and when adding more than two numbers, once learned, the method is quick and reliable.

## Subtraction

## Written methods for Subtraction

It is important that children's mental methods of calculation are practised on a regular basis and secured alongside their learning and use of written methods of subtraction.

The aim is that children use mental methods when appropriate, but for calculations that they cannot do in their heads they use a written method accurately and with confidence.

Children are taught and acquire secure mental methods of calculation and one written method of calculation for subtraction which they know they can rely on when mental methods are not appropriate.

This policy shows the possible stages of each written method for subtraction, each stage building towards a more refined method.

There are some key basic skills that children need to help with subtraction, which include:

- counting
- estimating
- recalling all addition pairs to 10,20 and 100 along with their inverses $(7+3=10,10-3=7$, $17+3=20,20-3=17,70+30=100,100-30=70$ )
- knowing number facts to 10 and their inverses ( $6+2=8,8-2=6$ )
- subtracting multiples of 10 (160-70) using the related subtraction fact, 16-7, and their knowledge of place value
- partitioning two-digit and three-digit numbers into multiples of 100,10 and 1 in different ways (432 into $400+30+2$ and also into $300+120+12$ )
- understanding and using subtraction and addition as inverse operations

Using and applying is a key theme and one of the aims of National Curriculum and before children move onto the next stage in written calculation it is important that their skills are broadened through their use and application in a range of contexts, these include:

- using inverse
- missing box questions
- using units of measure including money and time
- word problems
- open ended investigations

## Stage 1: Practical (taking away)

Prior to recording subtraction steps on a number line, children will work practically with equipment where they are 'taking away' a small group from a larger set of objects. As they become more confident, this practical subtraction will be mirrored on a number line so that the two are being done together. This will prepare them for the abstract concept of subtracting numbers rather than objects.
Stage 2 Number tracks and number lines

Counting back (to be introduced before counting up)
Steps in subtraction can be recorded from right to left on a number line. The steps often bridge through a multiple of 10 and, this is more efficient if children know how to partition 1-digit numbers.

Partition the second number only
$15-7=8$

$74-27=47$

or

$174-27=147$

With practice, children will need to record fewer jumps.

In this example, 7 has been partitioned into 2 and 5 which makes bridging through 10 more efficient

In these examples, 27 has been partitioned into tens and units then the 7 in 27 has been partitioned into 3 and 4 which makes bridging through 10 more efficient

Counting up (to be introduced after counting back)
Steps in subtraction can be recorded from left to right on a number line. The steps often bridge through a multiple of 10 .

When carrying out money calculations that involve finding change or when calculating time duration, children should use this method

With practice, children will need to record fewer jumps.
They will decide whether to count back or forwards, seeing both as 'finding the difference'. It is useful to ask children whether counting up or back is the more efficient for calculations such as $57-12$ or 86-77.

## Stage 3: Partitioning (expanded columnar method)

Children must write the calculation first so it is clear they are using the correct numbers.
Eg. 74-27=
Partition numbers into tens and units or hundreds, tens and units (using a grid makes this easier).

|  | 60 | 1 |  |
| :--- | ---: | ---: | ---: |
| - | 20 | 7 | 4 |
|  | 40 | 7 | 47 |

## Stage 4: Efficient (column method)

Column subtraction remains efficient when used with larger whole numbers or decimals, once learned; the method is quick and reliable.

## Multiplication

## Written methods for multiplication

It is important that children's mental methods of calculation are practised on a regular basis and secured alongside their learning and use of written methods of multiplication.

The aim is that children use mental methods when appropriate, but for calculations that they cannot do in their heads they use a written method accurately and with confidence.

Children are taught and acquire secure mental methods of calculation and one written method of calculation for multiplication which they know they can rely on when mental methods are not appropriate.

This policy shows the possible stages of each written method for multiplication, each stage building towards a more refined method.

There are some key basic skills that children need to help with multiplication, which include:

- counting
- estimating
- understanding multiplication as repeated addition
- recalling all multiplication facts to $12 \times 12$
- partitioning numbers into multiples of one hundred, ten and one
- working out products ( $70 \times 5,70 \times 50,700 \times 5,700 \times 50$ ) using the related fact $7 \times 5$ and their knowledge of place value
- adding two or more single-digit numbers mentally
- adding multiples of $10(60+70)$ or of $100(600+700)$ using the related addition fact, $6+7$, and their knowledge of place value
- adding combinations of whole numbers
- understanding and using division and multiplication as inverse operations

Using and applying is a key theme and one of the aims of National Curriculum and before children move onto the next stage in written calculation it is important that their skills are broadened through their use and application in a range of contexts, these include:

- using inverse
- missing box questions
- using units of measure including money and time
- word problems
- open ended investigations

## Stage 1: Practical (repeated addition)

Children will work practically with equipment grouping objects to see multiplication as repeated addition. As they become more confident, this practical grouping of objects will be mirrored on a number line using the vocabulary 'lots of', 'groups of', 'how many lots', 'how many times' so that the two are being done together. This will prepare them for the abstract concept of multiplying numbers rather than objects.

This image can be expressed as:

- 2 multiplied by 5
- two, five times
- 5 groups of 2
- 5 lots of 2

5 jumps of 2 on a number line

## Stage 2: Practical and pictorial arrays (towards grid method)

Children use arrays to demonstrate their understanding of commutativity for multiplication facts

$7 \times 3=21$

$3 \times 7=21$

Children use their knowledge of known multiplication tables

This $3 \times 7$ array can also be seen as $3 \times 5$ add $3 \times 2$

Stage 3: Partitioning (grid method)
$24 \times 3=72$
$24 \times 32=768$

| $X$ | 20 | 4 |  |
| :---: | :---: | :---: | :---: |
| 3 | 60 | 12 | 72 |

| $X$ | 20 | 4 |  |
| ---: | ---: | ---: | ---: |
| 30 | 600 | 120 | 720 |
| 2 | 40 | 8 | 48 |
|  |  |  | 768 |

## Stage 4 Efficient (column method)

| $24 \times 3=72$ | $1241 \times 3=3723$ |
| ---: | ---: |
| 24 | 1241 |
| $\times \quad 3$ |  |
| 72 | $\times \quad 3$ |
| 1 | 3723 |
| 1 |  |

Stage 5 Efficient (column method)
$24 \times 32=768$
24
$\times 32$
$\times 48$
720
768
$1245 \times 13$
1245
$\begin{array}{r}\times \quad 13 \\ \hline 3735\end{array}$
$\begin{array}{r}12450 \\ \hline 16185\end{array}$

In the examples given, it is also correct to multiply starting with the tens digit (i.e. multiplying by the most significant digit first)

## Written methods for division

It is important that children's mental methods of calculation are practised on a regular basis and secured alongside their learning and use of written methods of division.

The aim is that children use mental methods when appropriate, but for calculations that they cannot do in their heads they use a written method accurately and with confidence.

Children are taught and acquire secure mental methods of calculation and one written method of calculation for division which they know they can rely on when mental methods are not appropriate.

This policy shows the possible stages of each written method for division, each stage building towards a more refined method.

There are some key basic skills that children need to help with division, which include:

- counting
- estimating
- understanding division as repeated subtraction
- partitioning two-digit and three-digit numbers into multiples of 100,10 and 1 in different ways (432 into $400+30+2$ and also into $300+120+12$ )
- recalling multiplication and division facts to $12 \times 12$
- recognising multiples of one-digit numbers and dividing multiples of 10 or 100 by a single-digit number using their knowledge of division facts and place value
- knowing how to find a remainder working mentally, for example, find the remainder when 48 is divided by 5
- understanding and using division and multiplication as inverse operations

Using and applying is a key theme and one of the aims of National Curriculum and before children move onto the next stage in written calculation it is important that their skills are broadened through their use and application in a range of contexts, these include:

- using inverse
- missing box questions
- using units of measure including money and time
- word problems
- open ended investigations

## Division

## Stage 1: Practical (sharing)

Children will work practically with equipment sharing objects one to one.

## 12 cakes are shared equally between 3 people

## Stage 2: Number lines (grouping)

Children will move from sharing objects practically to grouping them, this will be mirrored on a number line, working from right to left so that they see division as repeated subtraction. This will prepare them for the abstract concept of dividing numbers rather than objects.

Each cake box holds 3 cakes, if I have 12 cakes, how many cake boxes will I need?

How many times can I subtract 3 from 12?

Using their knowledge of the inverse relationship between multiplication and division, children can use their multiplication tables when grouping on a number line, working from left to right.

How many groups of 3 are there in 12 ?

First without and then with remainders and ensuring that divisors offer an appropriate level of challenge.

## Stage 3: Short division

## $372 \div 3=124$

Stage 4: Long division
$560 \div 24=23$ r8
$432 \div 15=28 \mathbf{r 1 2}$

$(12 \div 15=0.8)$
remainder as a decimal

( $0.8=\frac{4}{5}$ )
remainder as a fraction

With long division, there is the opportunity to teach an expanded method first (i.e. chunking)

## Appendix One

## The Calculation Sequence - applying the skills

| The Sequence | Prompts | Planning |
| :--- | :--- | :--- |
| Provide an estimate for the <br> calculation | Using knowledge of number and <br> the number system, rounding and <br> approximating, make a reasonable <br> estimate. |  |
| Teach the calculation skill | What is the objective you are <br> teaching? Include example <br> questions, increasing in <br> complexity, for both operations. |  |
| Ensure you have taught the <br> inverse | Plan example questions, <br> increasing in complexity. Ensure <br> methods used are in line with <br> school calculation policy. Check <br> that children understand that <br> inverse can also be used to check <br> calculations |  |
| Devise similar calculations but <br> include units | Which units do you need to <br> include? Check the measures <br> applicable to your year group for <br> length, weight, capacity, money <br> and time. |  |
| Complete missing box questions | Include units in these questions as <br> above. The box may cover single <br> digits or an entire number. Vary the <br> position of the missing box within <br> the calculation. |  |
| Complete word problems, 1 and 2 <br> step, including units <br> ended investigations | Write problems, ensuring the <br> numbers are sized correctly in line <br> with the objective and that units <br> are also used. |  |
|  | Plan example questions and <br> investigations. <br> Ensure children are working with |  |
| the correct operations, appropriate |  |  |
| size of numbers and use of units |  |  |
| for context. |  |  |$\quad$

## Appendix Two

## Progression across the year groups Addition

|  | Typical calculations | Suitable methods |
| :--- | :--- | :--- |
| Y1 | U+U <br> TU + U (to 20 including zero) | Practical <br> Number line |
| Y2 | TU + U <br> TU + multiples of 10 <br> TU + TU <br> $U+U+U$ | Practical <br> Number line <br> Expanded columnar |
| Y3 | HTU + U <br> HTU + TU <br> HTU + HTU | Number line <br> Expanded columnar <br> Column |
| Y4 | THTU + HTU <br> THTU + THTU | Expanded columnar <br> Column |
| Y5 | THTU.t + THTU.t <br> THTU.th + THTU.th | Expanded columnar <br> Column |
| Y6 | THTU.tht + THTU.tht | Column |

## Progression across the year groups

 Subtraction|  | Typical calculations | Suitable methods |
| :--- | :--- | :--- |
| Y1 | U-U <br> TU -U (to 20 including zero) | Practical <br> Number line |
| Y2 | TU -U <br> TU -multiples of 10 <br> TU -TU <br> U -U -U | Practical <br> Number line <br> Expanded columnar |
| Y3 | HTU -U <br> HTU - TU <br> HTU -HTU | Number line <br> Expanded columnar <br> Column |
| Y4 | THTU -HTU <br> THTU -THTU | Expanded columnar <br> Column |
